

RWTH E-Mail and VPN

1 E-Mail

- To get Thunderbird to properly talk to the RWTH-servers you need credentials:
 - Username: `<tim_id>+rwth-aachen.de` e.G. `mm123456+rwth-aachen.de`
 - Password: **Your Password** (if you didn't change it it is the same as for eduroam)
- Thunderbird has a database with server settings for the most common email providers. Unfortunately the RWTH isn't in that list so you have to enter the data yourself:
 - Imap-Server:
 - Server: `mail.rwth-aachen.de`
 - Port: 993
 - Protocoll: SSL
 - Authentication: "Password, normal"
 - SMTP-Server:
 - Server: `mail.rwth-aachen.de`
 - Port: 587
 - Protokoll: STARTTLS
 - Authentication: "Password, normal"

2 VPN

You can configure the RWTH VPN by clicking on the NetworkManager symbol in the tray on the top right next to the time and date. In the menu select "VPN connection" and then "Configure VPN". There you click "Add". There you may need to select "Cisco compatible VPN-Client (vpnc)" and press "Create". There you have to enter the following settings:

- Name: anything, e.g. "RWTH Full Tunnel"
- Gateway: `vpn.rwth-aachen.de`
- Group name: FullTunnel
- User password: [Your password for WLAN]
- Group password: medical
- Username: [in der Form ab123456]
- Domain: [empty]
- Encryptopn method: [Leave as it is]
- NAT-Traversal: [Leave as it is]

Alternatively you can download the configuration from <http://tinyurl.com/n68obp3> and import it.
